

Assignment wk3-Day2: Integration of JIRA

Connect JIRA Added.

The screenshot shows a web browser at localhost:5173 displaying the 'User Story to Tests' application. The page has a green header with 'AI-Powered Test Generation'. The main heading is 'User Story to Tests' in large black and green font. Below the heading, there are two buttons: 'Connect Jira' (green) and 'Reset' (light green). A subtitle reads 'Turn user stories into comprehensive, structured test cases in seconds.' Below this, there is a form with a 'Story Title *' label and an input field.

The second screenshot shows the same application with the 'Connect to Jira' form expanded. The form has three input fields: 'Base URL' with the value 'https://pradeepa0127.atlassian.net/', 'Email ID' with the value 'pradeepakarthi17@gmail.com', and 'Jira API Token' with a masked value '*****'. A green 'Connect Jira' button is at the bottom right of the form. The 'Connect Jira' button from the previous screenshot is still visible above the form.

Pulled the user stories from JIRA board.

Story Title *

SCRUM-6: HC-311 — Automated Insurance Pre-Authorization for Radiology Tests

Summary *

As a billing coordinator, I want the system to automatically verify a patient's insurance coverage and pre-authorize radiology tests before scheduling, so that delays and manual verification errors can be reduced.

Description

Before scheduling any CT, MRI, or ultrasound procedure, the system should trigger an API call to the insurance provider to check if the procedure is covered under the patient's plan. If authorization is required, it should initiate the pre-authorization process automatically and store the approval ID in the patient record.
Epic: Financial & Billing Workflows - Insurance Automation

Acceptance Criteria *

Given a patient is scheduled for a radiology test, When the billing coordinator selects "Schedule test", Then the system should verify insurance eligibility via API. Given the test requires pre-authorization, When the request is sent, Then the system should store the authorization ID and approval date in the follow format

Your test cases will appear here

Fill in the story details on the left and hit Generate. We'll craft positive, negative, edge, and more test cases for you.

Positive

Negative

Authorization

Testcases are generated.

The screenshot shows a web application interface with a browser address bar at the top displaying 'localhost:5173'. The interface is divided into two main sections. The left section contains a 'Story Title' field with the text 'SCRUM 8: HC-171 - Automated Insurance Pre-Authorization for Radiology Tests'. Below this is a 'Summary' section with a paragraph: 'As a billing coordinator, I want the system to automatically verify a patient's insurance coverage and pre-authorize radiology tests before scheduling, so that delays and manual verification errors can be reduced.' The 'Description' section follows, containing a paragraph: 'Before scheduling any CT, MRI, or ultrasound procedure, the system should trigger an API call to the insurance provider to check if the procedure is covered under the patient's plan. If authorization is required, it should initiate the pre-authorization process automatically and store the approval ID in the patient record. EpicFinancial & Billing Workflows - Insurance Automation.' Below the description is an 'Acceptance Criteria' section with a paragraph: 'Given a patient is scheduled for a radiology test, When the billing coordinator selects "Schedule Test", Then the system should verify insurance eligibility via API. Given the test requires pre-authorization, When the request is sent, Then the system should store the authorization ID and approval date in the billing record. Given a test is not covered, When the result is received, Then the system should notify both the coordinator and patient, and offer alternative payment options.' The 'Additional Info' section at the bottom of the left panel contains the text 'Any additional information (optional)'. The right section is titled 'Generated Test Cases' and features three tabs: '10 test cases', 'Model generated on 1/26', and 'Suite: 2029'. Below the tabs is a table with four columns: 'TEST CASE ID', 'TITLE', 'CATEGORY', and 'EXPECTED RESULT'. The table contains five rows of test cases, each with a unique ID, a title describing the test scenario, a category (Positive, Negative, or Authorization), and a detailed expected result.

TEST CASE ID	TITLE	CATEGORY	EXPECTED RESULT
TC-001	Successful insurance eligibility verification and pre-authorization for covered radiology test	Positive	System calls insurance API, receives eligibility = true, pre-authorization required = true, stores authorization ID and approval date in billing record, and displays confirmation message
TC-002	Insurance eligibility verification passes and no pre-authorization required	Positive	System calls insurance API, receives eligibility = true, pre-authorization required = false, schedules test without storing authorization ID, and shows success message
TC-003	Insurance eligibility verification fails (test not covered)	Negative	System calls insurance API, receives eligibility = false, displays notification to coordinator, sends email/SMS to patient with alternative payment options, and does not schedule the test
TC-004	Insurance API returns error (timeout)	Negative	System shows retry option, logs error, does not schedule test until successful verification, and informs coordinator of temporary failure
TC-005	Pre-authorization request succeeds and stores correct data	Authorization	Authorization ID and approval date are saved in the billing record and displayed in the test scheduling summary
